

COMMONWEALTH OF DOHINICA

## LABOUR FORCE SURVEY November 1999

## Central Statistical Office Ministry of Finance And Planning Kennedy Avenue Roseau <br> Dominica

## PREFACE

The 1999 Labour Force Survey was conducted from November 16 and covered a four week period. The previous Labour Force survey was conducted in 1997 and such surveys will continue on a two year interval.

The Central Statistical Office expresses its sincere gratitude to those involved in the survey and persons who gave their full cooperation to the enumerators particularly in the interview stage of the survey. We also wish to acknowledge the valuable contribution of Mr. Desmond Hunte, Survey Consultant in this exercise.

## Chief Statistician

## TABLE OF CONTENTS

PREFACE .....  i
SURVEY DESIGN ..... $1-2$
CONCEPT AND DEFINITIONS ..... 3-5
ANALYSIS ..... $6-10$
TABLES

1. ESTIMATED NON-INSTITUTIONAL POPULATION BY AGE AND SEX 1999 ..... 11
2. SUMMARY TABLE OF 15 YEARS AND OVER POPULATION BY EMPLOYMENT STATE 1999 ..... 11
3. NON-INSTITUTIONAL POPULATION 15 YEARS AND OVER \& LABOUR FORCE BY EMPLOYMENT STATUS. SEX AND PARISH ..... 12
4. NON-INSTITUTIONAL POPULATION 15 YEARS AND OVER \& LABOUR FORCE BY EMPLOYMENT STATUS. SEX AND AGE GROUP ..... 13
5. EMPLOYED PERSONS BY LEVEL OF EDUCATION. PARTICIPATION RATE AND SEX ..... 14
6. DISTRIBUTION OF EMPLOYED PERSONS BY OCCUPATION FOR WHICH TRAINIED ..... 14
7. DISTRIBUTION OF EMPLOYED PERSONS BY STATUS IN EMPLOYMENT AND SEX..
8. DISTRIBUTION OF EMPLOYED PERSONS BY OCCUPATION AND SEX ..... 15
9. DISTRIBUTION OF EMPLOYED PERSONS BY INDUSTRY AND SEX ..... 16
10. DISTRIBUTION OF EMPLOYED PERSONS BY ACTUAL AND USUAL HOURS WORKED PER WEEK AND SEX ..... 17
11. DISTRIBUTION OF EMPLOYED PERSONS WORKING LESS THAN 32 HOURS PER WEEK ..... 18
12. DISTRIBUTION OF MULTIPLE JOB-HOLDERS BY MAIN AND SECONDARY STATUS IN EMPLOYMENT ..... 19
13 DISTRIBUTION OF MULTIPLE JOB-HOLDERS BY MAIN AND SECONDARY OCCUPATION ..... 20
14 DISTRIBUTION OF EMPLOYED PERSONS BY MONTHLY INCOME GROUP AND SEX ..... 21
I5 NUMBER OF EMPLOYEES OF SELF-EMPLOYED PERSONS WHO HAVE PAID HELP ..... 21
I6 DISTRIBUTION OF EMPLOYED PERSONS BY RELATIONSHIP TO HEAD OF HOUSEHOLD AND SEX ..... 22
17 UNEMPLOYED PERSONS BY LEVEL OF EDUCATION AND SEX ..... 22
18 UNEMPLOYED PERSONS BY RELATIONSHIP TO HEAD OF HOUSEHOLD AND SEX ..... 23
19 DISTRIBUTION OF UNEMPLOYED PERSONS BY STATUS IN EMPLOYMENT ..... 23
20 DISTRIBUTION OF UNEMPLOYED PERSONS BY LENGTH OF TIME WITHOUT WORK ..... 23
21 DISTRIBUTION OF UNEMPLOYED PERSONS BY INDUSTRY OF LAST EMPLOYMENT ..... $2+$
22 DISTRIBUTION OF UNEMPLOYED PERSONS BY INDUSTRY OF LAST EMPLOYMENT .....  4
23 YOUTH IN THE LABOUR FORCE BY SINGLE YEARS OF AGE AND SEX. ..... 25
24 UNEMPLOYED YOUTH BY SINGLE YEARS OF AGE AND SEX ..... 25
25 DISTRIBUTION OF YOUTH NOT IN LABOUR FORCE BY REASON FOR UNAVAILABILITY ..... 26
26 PERSONS NOT IN THE LABOUR FORCE BY PARISH AND SEX ..... 26
27 PERSONS NOT IN THE LABOUR FORCE BY AGE GROUP AND SEX ..... 27
28 PERSONS NOT IN THE LABOUR FORCE BY LEVEL OF EDUCATION AND SEX ..... 27
29 PERSONS NOT IN THE LABOUR FORCE BY REASON FOR UNAVAILABILITY FOR WORK ..... 28
30 PERSONS NOT IN THE LABOUR FORCE BY MAIN MEANS OF FINANCIAL SUPPORT ..... 28
CHARTS
I POPULATION I5 YEARS AND OVER BY PARISH ..... 29
2 POPULATION RATES BY PARISH AND SEX ..... 30
13. AGE SPECIFIC PARTICIPATION RATES BY SEX ..... 31
14. UNEMPLOYMENT RATES BY SEX AND PARISH ..... 32
15. UNEMPLOYMENT RATES BY SEX AND AGE GROUP ..... 33
16. EMPLOYED PERSONS BY INCOME GROUP ..... $3+$
17. PERCENTAGE DISTRIBUTION OF EMPLOYED PERSONS BY ACTUAL NUMBER OF HOURS WORKED ..... 35
18. EMPLOYED PERSONS BY OCCUPATION ..... 36
19. EMPLOYED PERSONS BY INDUSTRY ..... 37
20. LNEMPLOYED PERSONS BY LENGTH OF TIME WITHOUT WORK ..... 38

## The Dominica Labour Force Survey 1999

## Introduction

The Dominica Labour Force Survey was designed as a Household Survey with its primary objective being to provide up to date data on the labour force characteristics of the Population of the Commonwealth of Dominica.

The design also affords the ability to measure actual changes in the characteristics of the labour force if surveys are conducted on a continuing basis, besides providing estimates of the current levels of employment and unemployment.

The survey design can also be used as a vehicle for conducting other houschold survers which can provide data on subjects of interest to both government and the private scetor for the purposes of planning and formulating policies.

## Survey Design

The Dominica Labour Force Survey Design is a two stage sample design with the selcetion of the primary sampling units (P.S.U.) at first stage being proportional to size. The primary sampling units are the enumeration districts (ED's) into which the country was sub-divided for the conduct of censuses. The second stage is the selection of the ultimate sampling units (U.S.U.) which are clusters of household one selected from each of the selected P.S.U.

The sampling frame for the survey design was the 1991 Population and Housing Census. This provided the data for allocating the sample by parishes, as well as the ordering of ED's within parish.

Administratively, Dominica is divided up into eleven (11) parishes, namely Roscau, rest of St. George, St. John. St. Peter, St. Joseph, St. Paul, St. Luke, St. Mark, St. Patrick, St. David and St. Andrew. For ease of enumeration during the Population and Housing Censuses, these parish divisions are further broken down into enumeration districts (ED's). The number of ED's in a parish division varies, and range from 48 in Roseau, to 5 each in St. Petcr and in St. Luke. However. for the survey St. John and St. Peter being contiguous parishes were joincd together. The same was done with St.

## --- Luke and St. Mark.

Besides the variation in the number of ED's in each parish, within each of these parishes there are also variations in the sizes of the ED's both in terms of the number of households and the population. For example during the 1991 Population and Housing Census the size of ED's in Roseau ranged from 178 households in the largest ED to 34 in the smallest. However, the majority are close to the average of 80 households. The same applies to all of the other parishes although the average size of the EDs varied However, the largest ED was in St. Patrick with 211 households.

For the Labour Force Survey it was determined that a sample size of about 1200 would be adequate taking into account the resources available. In addition it was neccssary to have these 1200 households distributed almost cvenly over a three month period. As well. it was necessary for the survey design to take into account the need to have each parish division adequately represented. However, because of time constraints, it became necessary to conduct the survey over a one month period.

In order to incorporate the above mentioned features in the design a two stage sample design was developed. At the first stage ED's (P.S.U.) are selected with probability proportional to therr size (fa) at the time of the 1991 Census. At the second stage a cluster of houscholds is sclected from cach selected ED with a probability (fb) so that the end result is that cach houschold has the same probability ( $f$ ) of being selected. That $f=f a x f$.

The total number of households in the country was broken up into clusters of 8 houscholds cach. Each parish was then allocated a number of clusters in proportion to its size, that is, the number of households at the time of the census with the proviso that it must bc a multiple of 30 . Within cach parish each ED was assigned a number of clusters which must be an integer, in proportion to its sizc. the sum of clusters of all ED`s being equal to the number of clusters assigned to the parish. This meant that the average cluster size varied slightly between parishcs and was not 8 houscholds but close to that size.

ED's within each parish were put in descending order of the proportion of workcrs in a given occupation/industrial group depending on whether the parish was considered urban or rural. In the urban parishes of Roseau, and the rest of St. George the occupational grouping used was a combination of Managers, Senior Public officials, Professionals and sub-professionals All other parishes were treated as rural and the criterion was the proportion of workers engaged in agriculture. Having arranged the ED's in this manner a systematic selection of ED's was made with an interval of 10.

The ED's thus selected formed a grand sample consisting of 3 sub samples. These were number 101. 102, 103, 201, 202, 203 etc. the last digit being the sub sample number. For the 1999 Labour Force Survey sub samples 1 and 2 were chosen. The sampling fraction was thus $2 / 3 \times 1 / 10=1 / 15$. This sampling fraction was expected to yield approximately 1200 households.

Because of the time that had elapsed between the formation of the frame. 1991, and the conduct of the survey, 1999, changes in the sizes of most ED's would have resulted duc to population increases as well as population loss. It was therefore necessary to carry out a new listing of selected ED`s from which the sample of households would be drawn.

For the listing of an enumeration district, the interviewer was given full details of the boundarics of that district which aimed at ensuring that every building in the country is identified with one and only one enumeration district. He/she was also given a sketch map of the enumeration district which clearly showed these boundaries, and which included all roads and traces as well as other useful land marks. These sketch maps, except in the few cases in which more recent sketch maps had been prepared, were the maps which were prepared for and used at the 1991 Census of Population.

The sketch map also showed the point at which the enumerator should begin his/her listing and indicated by arrows the direction which the he/she had to follow:

At the listing stage, the interviewer was required to visit every building and to list and serially number every single household in the enumeration district in a Listing Record.

To select the cluster of household which was to be enumerated within a given enumeration district (first stage sampling unit) the "Listing Records" were returned to the office where the cluster of households for the enumeration was selected as a svstematic sample of households with a random starting point. The sampling interval at this stage was equal to the number of sampling unts allocated
to the enumeration district. The term "cluster" in the survey docs not, thercfore, necessary relate to a group of contiguous households, to which is the term normally refers.

The sampling fraction at the second stage, (i.e. for the selected of the cluster of households), was therefore inversely proportional to the size (number of sampling units) of the E.D. It sloould be noted. however, that the actual number of households in a cluster in any given enumeration district was not predetermined, but depended upon the number of households existing in the enumeration district at the time of listing. A total of 160 Clusters were selected, which were expected to yicid the 1200 households.

## Concepts and Definitions

## Household

It consists of one or more persons living together (i.e sleeping most nights of a week), who occupy a whole or part of a dwelling unit,who have common arrangements for housekceping and who share at least one daily meal.

It is important to note that a member of a household need not be a relative of the main family; e.g. a boarder or a domestic servant who sleeps in most nights a week is a member of the houschold. It is possible for a household to consist of just one person, or of more than onc family, as long as they share living arrangements. A group of unrelated persons living together can also comprise a household.

## Head of Household

For survey purposes every household must have a head. The head is identified in the following situations:
In a one person household, that person is the head.
The person who carries the main responsibility for the affairs of the household and/or is the chicf breadwinner is the head of the household.

The person recognized as the head of the household by the respondent(s) should be accepted as such for survey purposes.

In the case of a group of unrelated persons, sharing a dwelling on an cqual basis, that member of the group whom others acknowledge as such should be taken as thc head.

A person running a small guest house is considered to be the head of that household. In cascs where the respondent does not accept the idea of a head, assign a head, and continue the interview:

## Economically Active Population

The economically active population comprises all persons of either sex who furnish the supply of labour for the production of goods and services as defined by the United Nation System of National Accounts and Balances, during a specified reference period.

According to these systems the production of goods and services includes all production and processing of primary products, whether for the market. for barter, or for own consumption, the production of all other goods and services for the market and, in the case of the households which produce such goods and services for the market, the corresponding production for own consumption.

## Age Limit and Scope for Economic Activity

The age limit used in this survey is 15 years, which is inline with the United Nations Principles and Recommendations for the Population Housing Censuses

## Labour Force

The term "Labour Force" refers to the categories of persons according to their activitics during the short reference period (such as one week or one day) by using a specific set of rules.

$$
\begin{array}{ll}
\text { Labour Force } & =\text { Employed }+ \text { Unemployed } \\
\text { Population } & =\text { Labour Force }+ \text { Not in the Labour Force }
\end{array}
$$

## Priority Rules

The labour force framework uses a set of priority rules for classifying the working age population into three basic categories of the framework: precedence is given to employment over unemployment and unemployment over economic inactivity.

## Persons Not in the Labour Force

Persons not in the labour force, or, equivalent, in the "population not currently active", comprises all persons not classified as employed or unemployed during the reference period and hence not currently active, including children and young people below the age specified for measuring the economically active population.

## Employed Persons

According to the 1982 international definition of employment (ILO 1983) the "employcd" comprises all persons above the specified age for measuring the economically active population who during the specified period (one week or one day) were in the categories:
Paid employment:
"at work" persons who during the reference period. performed some work for the wages or salary, in cash or in kind:
"with a job but not at work" persons who having already worked in their present job. were temporarily not at work during the reference period but had a formal attachment to their job

## Self employment:

"at work" persons, who performed some work for profit or family gain, in cash or kind:
"with an enterprise but not at work" persons with an enterprise a farm or a service undertaking, who were temporarily not at work during the reference period for some specific reason.

## The One Hour Criterion

The one hour criterion in the definition of employment is to cover all types of employment that may exist in a given country, including short-time work, casual labour. stand-by work and other types of irregular employment. It is also a necessary criterion if total employment is to correspond to aggregate production. The one hour criterion in the definition of employment is also fundamental in defining unemployment as a situation of total lack of work.

## Unpaid Family Worker

Unpaid family workers. though participating in the activities of a houschold enterprise are not
considered to have an enterprise of their won. Accordingly. they cannot be "with an enterprise but not at work" and therefore unpaid family workers not at work are not to be included among the employed.

## Hours of Work

The notion hours of work is directly linked to the concept of employment sunce the term "some nork" in the intemational definition of employment, is to one interpreted as "work for at least one hour" during the reference period. Among the various concept of hours of work, two have particular relevance in the labour force surveys: actual and usual hours of work. Thirty-two hours of work per week is the dividing line between full-time and part-time employment

## Status in Employment

Status in employment serves to classify employed persons according to therr employer. The classification thus used are public sector employce, private sector employee, employer, that is a self employed person with paid employee(s), own account worker, that is a self-employed person with no paid help, and unpaid family worker, that is someone employed in a family business or enterprise but does not receive a wage or salary.

## Occupation

A set of jobs whose main tasks and duties are characterised by a high degrec of similarity constitutcs an occupation. Persons are classified by occupation through their relationship to a past, present or future job. A job is defined as a set of tasks or duties exccuted or meant to be executed by a person.

## Industry

The classes (industries) of ISIC are defined so that as far as possible the following two conditions are satisfied: (a) the production of the category of goods and services which characterize a given class accounts for the bulk of the output of the units classificd to that class; and (b) the class contains the units which produce most of the category of goods and services which charactcrize it This first condition is required in order that establishments or similar units, may be classified according to kind of economic activity uniquely and easily and in order that the units included in a given class will be as similar to each other as feasible.

## Unemployment

The concept of unemployment (ILO 1983) is based on three criteria to be satisfied simultancously: "without work", "currently available for work" and "seeking work". Accordingly. the "unemployed" comprises all persons above the age specified for measuring the economically active poputation who during the reference period were:
"without work", i.e. were not in paid employment or scif-employment. as specificd by the international definition of employment;
"currently available for work", i.e. were available for paid employment or self-employment during the refcrence period:
"seeking work", i.e had taken specific steps in a specified recent period to scek paid employment or self-employment.

For purposes of the Dominica Labour Force Survey the reference period for secking work was 3 months.

## Data Highlights

## Introduction

The analysis that follows, focuses firstly on the age, education and area of residence of the persons that comprise the labour force of Dominica. It then looks at the characteristics of the employed and unemployed persons separately. It then examines the youth, that is persons 15 to 24 years of age, followed by an examination of those persons that are out of the labour force. Some comparison is made with the results of the 1997 survey mainly to highlight any major differences or changes. It is also necessary to point out that Table 2 and succeeding tables are based on the survey, while table 1 is based on mid-year estimates. In addition. totals will not always be the same, because of rounding off.

## Labour Force

The first and most striking difference between the results of the 1997 and 1999 surveys was the decline in the total unemployment rate from $23.1 \%$ to $15.7 \%$, a decline of almost one third. This decline was about the same for both males, $19.6 \%$ to $131 \%$, as it was for females, $27.2 \%$ to $19.4 \%$. Of significance also, were the increase in participation rate for males, $74.9 \%$ to $75.5 \%$ and the decline in participation rate among females, $59.6 \%$ to $54.5 \%$ (Table 2).

At a parish level, there were declines in the participation rate for Roseau, the rest of St. George, St. John/St. Peter, St. Paul, St. Patrick and St. Andrew. The largest decline took place in St. John/St. Peter from $70.8 \%$ to $59.8 \%$ followed by rest of St George from $73.7 \%$ to $64.0 \%$, while for St. Paul the decline was minimal $73.9 \%$ to 73.1 . In St. Luke/St Mark there was a significant increase, from $57.2 \%$ to $67.4 \%$ and to a lesser extent in St. David where it increased from $62.2 \%$ to $71.2 \%$.(Table3).

While St. Patrick showed the highest decrease in unemployment rate from $45.9 \%$ to $324 \%$, the unemployment rate in this parish was the highest overall among the parishes. The same picture was reflected among the data for both males and females. As in 1997, St. Andrew had the lowest unemployment rate, $5.3 \%$, followed by St. Joseph, $10.0 \%$, and St John/St. Peter, $11.3 \%$. However, the unemployment rate by parish and sex reflected a different picture. Among males, St. Andrew had the lowest unemployment rate, $3.6 \%$, but was followed by St. David, $4.8 \%$, and then St. Joseph, $7.1 \%$, the only parishes with single digit unemployment rates. Among the females, only St. Andrew had single digit unemployment rates, $8.2 \%$. St. John/St. Peter, $10.8 \%$, and Roseau, $12.5 \%$, followed this. The unemployment rate remained significantly high among females in St. Paul ( 24 1\%) St. Luke/St. Mark ( $32.6 \%$ ), St. Patrick ( $35.6 \%$ ) and St. David ( $26.9 \%$ ). It should be noted that among males it was only in St. Patrick (30.5\%) was the unemployment rate above 20\% (Table3).

The data revealed that there was a steady decline in the unemployment rate as age increased regardless of sex. As might be expected the unemployment among the youth was the highest with those aged 15 to 19 years having an unemployment rate of $42.8 \%$ and those 20 to 24 years a rate of $27.4 \%$. The rates were slightly higher among young fentales than among young males. The labour force participation rate showed a general increase with age peaking at age 40 to 44 years and declining thereafter. (Table 4)

## The Employed

The vast majority ( $61.2 \%$ ) of the employed had a primary education, 17,157 out of 27,999 , with a further $5,680(20.3 \%)$ having a secondary education. However, there was a significant difference between the sexes. Almost half the employed females, 5,799 ( $53 \%$ ) out of 10,962 , had a primary education with a further $3,074(28 \%)$ having a secondary education. Among the males, $11,358(67 \%)$ of the 17,059 employed had a primary education with a further 2,606 ( $15 \%$ ) having a secondary education (Table 5).

In terms of training, just over half (53.9\%) of those employed had no occupational training with the situation about the same for both males and females. However, employed females tended to have better training than their male counterparts, as managers, technicians and clerks. However, in the professional and craft related fields, a greater proportion of males had training. (Table 6)

As in 1997, the private sector was the biggest employer accounting for $39.7 \%$ of all employed persons (Table 7). This, however, was a decline from 1997 when the proportion was $44.3 \%$. However, as in 1997, among females the proportion employed in the private sector, $45.6 \%$, was greater than among males, $35.9 \%$. The majority of males were selfemployed. The proportion of workers in the public sector declined from $21.3 \%$ to $18.8 \%$ ( 5,460 to 5,286 ). This was true for both males and females.

In terms of occupation, the majority of persons were employed in agricultural occupation, 6,840 or $24.4 \%$, with males dominating this sector, 5,488 or $32.2 \%$ of all employed males For females, the dominant occupation was elementary occupations, particularly workers in private homes, which accounted for 2,397 or $22.8 \%$ of all employed females followed by service and sales workers, 1,742 ( $15.9 \%$ ), clerks, 1,516 ( $13.8 \%$ ), and technicians or subprofessionals, 1,557 ( $14.2 \%$ ). Only $2.7 \%$ of all employed persons were professionals (Table8).

Following the trend in occupations, the data revealed that $7,208(25.7 \%)$ were employed in the agriculture industry of which 5,446 were males and 1,762 , females (Table 9). The wholesale and retail trade was the next major industry accounting for 4,059 or $14.7 \%$ of all employed persons.

Among males, 2,098 or $12.3 \%$, found employment in the construction industry and 1,949 $(11.6 \%)$ in the wholesale and retail trade. Among females, the wholesale and retail trade was the largest industry of employment, 2,110 (19.2\%) followed by agriculture and private homes. Education also accounted for a large proportion, $9.2 \%$, of employed females

Over $60 \%$ of all workers usually worked 40 or more hours per week and in fact did so during the November 1999 Survey Week. (Table10). However 11\% worked less than 20 hours Generally males work more hours than females under normal circumstances and this was reflected in the data. Sixty-five percent of employed males worked 40 hours and more as compared $60.5 \%$ for females.

Of those persons who worked less than 32 hours, but were available for additional work during the reference week, $42.0 \%$ reported that full-time work for them was less than 32 hours. However $30.3 \%$ reported that they were available for additional work but could not find any. (Tablell).

A total of 1,874 persons or $6.7 \%$ of all employed persons were engaged in a second job. The majority of these were males, 1,505 . Most of them, 1,073 , worked as own account workers in their second job or in the private sector, 609 . These accounted for $89.9 \%$ of secondary jobs. By comparison in their main jobs, the private sector accounted for $33.6 \%$, while $37.2 \%$ were own account workers. However, a significant proportion, $22.4 \%$, was employed in the public sector. About one third of all females who had a second job, worked in the public sector in their main job compared with $19.7 \%$ among males (Table 12).

Generally persons with more than one job worked in agricultural occupations, $37.3 \%$, or in elementary occupations such as labourers, $20.1 \%$, or as craft related workers such as masons, carpenters etc. $14.6 \%$. In addition, they worked in these same occupations in their second jobs (Table 13). This pattern was about the same for both males and females

The median income for all workers was $\$ 834$ per month, that is, $50 \%$ of all workers were earning less than $\$ 834$ per month. Only $12.9 \%$ reported income of $\$ 2000$ per month or more Among females the median income was $\$ 713$ per month with $11.7 \%$ reporting incomes of $\$ 2000$ per month and more. Among males the median income was $\$ 892$ with $13.6 \%$ reporting monthly incomes in excess of $\$ 2000$ per month (Table 14).

The majority ( $53.8 \%$ ) of self-employed persons employed 2 to 4 persons, though a significant proportion, $22.3 \%$, reported having 10 or more persons employed (Table 15).

## The Unemployed

There were 5,207 unemployed persons of whom 2,564 were males and 2,643 were females The respective unemployed rates were $15.7 \%, 13.1 \%$ and $19.4 \%$. Unemployment rates were highest among those with just a primary education, $17.7 \%$ or a secondary education, $14.9 \%$, although it was also high, $14.4 \%$, among those with a technical/vocational education. The pattern was basically the same among both males and females (See Tables 2,3 and 17)

A substantial proportion, $26.0 \%$, of the unemployed had never worked before. However. $77.8 \%$ of those who had worked before, had worked in the private sector, while 11.95 had worked in the public sector. This pattern was true for both males and females (Table 19)

Overall about one third of the unemployed and about $4.52 \%$ of those whe hat prenous experience had not worked for a year or longer prior to the survey for females this latar proportion was $55.3 \%$, while for males it was $35.2 \%$. In all cajes of those witi prewras work experience only less than $5 \%$ was out of wo:k lese than ne month thave? ?

Of those who had previously worked, the sast majority had worked an elememan occupatons ( $46 \mathrm{l} \%$ ) most probably labourers, perhaps in the agriculture and construction industries. For males, this occupational group accounted for $506 \%$ of the unemployed who had previously worked as compared with $415 \%$ for females For males, craft and related occupation ( $25.2 \%$ ) and service and sales workers ( $11.0 \%$ ) were the next nccupations in which they had worked while for females, service and sales workers ( $26,5 \%$ ) and clerk; ( $85 \%$ ) were the dominant occupation (Table 21)

The majority of males ( $40.7 \%$ ) last worked in the construction industry, with agriculture ( $13.2 \%$ ) being the next dominant sector in which they worked For females, the highest proportion, $23.4 \%$, had last worked in private homes, followed by the manufacturing sector ( $17.0 \%$ ) (Table 22). The observed patterns by occupation and industrial sector for the unemployed were similar to that observed in 1997

## Youth

Tables 23 and 24 provide data on 15-24 year old youth by single year age. As might be expected the participation rate increases with age, while the unemployment rate declines with age. Youth who were not in the labour force were mainly in school, $77.7 \%$ overall, $8.40^{\circ} \mathrm{o}$ for males and $72.5 \%$ for femaies with $20.4 \%$ of females engaged in household activities Overail, $40.5 \%$ of all youth were out of the labour force, $363 \%$ for males and $46.1 \%$ fir females (Table 25).

## Out of Labour Force

A total of 17,624 persons were out of the labour force, 6,272 males and 11,532 fenales The majority of persons out of the labour force came from Roseau $222 \%$, St Patrick, $144^{2} \%$ or St. Andrew, $14.5 \%$, and it was the same pattern for both males and females (Table 26)

The age groups at the ends of the spectrum, 15 to 19 years ( $228 \%$ ) and 65 years and ovei ( $374 \%$ ) accounted for most of the persons out of the labour force The numbers were $4,0,37$ and 6,625 persons respectively Among the other age groups the numbers ranged from. 495 to those 45 to 49 years and 95 for those aged 25 to 29 years The 60 to 64 years of accounted for 1,243 persons (Table 27).

The majority, $11,666(65.9 \%)$, had just a primary education, alihough $3,404(192 \%)$ had a secondary education and 209 ( $1.2 \%$ ) had a university education. A total of $5.503(3110 \%)$ persons were out of the labour force because of old age or retirement. with a further 3,54 ? ( $206 \%$ ) being ili or disabled. The others were engaged in household dutses $4.179(23 \mathrm{Km}$ )

The vast majority of persons out of the labour force were supported by friends or relatires including parents ( $53.7 \%$ ) or by their spouse/partner ( $198 \%$ ) A smaller proportion. the retirees most likely, supported themselves from savings/investments ( $10.9^{\circ} \%$ A small propotion ( $35 \%$ ) was dependent on remittances from ahroad iTahlo an

Table 1. Estimated Non-Institutional Population by Age and Sex, 1999
