PREFACE

This is the fifth publication on National Accounts issued by the Central Statistical Office. This issue provides estimates of **Gross Domestic Product** in current and constant prices at factor cost, and also of expenditure on GDP at current prices, Gross National Disposable Income, Appropriation and Capital Finance. Additionally, it includes the **Balance of Payments** components from 1986 to 1993. The accounts of Central Government as well as government enterprises and some key economic indicators are also included.

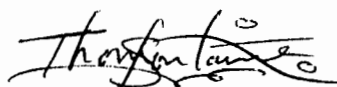

In presenting this report, the standard methodology adopted for the OECS countries which is broadly consistent with the revised United Nations **System for National Accounts (SNA)** has been used. However, due to serious manpower constraints and other pertinent problems, the scope of the series has been greatly restricted. Consequently, a number of the tables which have been recommended in the SNA are not here presented. Compilation of the Balance of Payments estimates which is undertaken with assistance from the Eastern Caribbean Central Bank follows standard procedures recommended by the International Monetary Fund's (IMF) "Blue Book".

The material presented in this issue consists of revised National Accounts estimates for the period 1980 to 1992 and preliminary estimates for 1993. Substantial revisions were made to the series to incorporate the new base year of 1990. Previously, 1977 was used as the base year. In the process of revising the series, some changes were made to a few of the deflators as a means of improving on the quality of the estimates. Also, revised Balance of Payments estimates are presented from 1986 to 1993. Heavy reliance is being placed on an annual survey of establishments which provides most of the source data for the compilation of these statistics.

The Central Statistical Office expresses sincere thanks to the many establishments which continually provide us with the relevant data. In addition the services rendered by **Mrs Hazel Corbin** of the OECS and **Miss Lucilla Lewis** of the ECCB have gone a long way in finalizing the National Accounts and Balance of Payments statistics. **Mr Thomson Fontaine** of the CSO over the past few years has greatly assisted in the development of the National Accounts statistics through data collection, compilation and analysis of the estimates and undertook responsibility for the preparation of this issue.

DEFINITION OF COMPONENTS OF
THE ACCOUNTS AND RELATED AGGREGATES

I. COMPENSATION OF EMPLOYEES:

This is defined to include all payments by resident producers of wages and salaries to their employees in cash and in kind, and of contributions paid or imputed, in respect of their employees, to social security schemes and to private pensions, family allowance, casualty insurance, life insurance and similar schemes.

(1) Wages and Salaries: This is defined to include all payments which employees receive in respect of their work whether in cash or in kind, and before deductions to Social Security, Income Tax, etc. Included are:

- (a) Commissions
- (b) Tips
- (c) Bonuses
- (d) Cost of living and dearness allowances
- (e) Fees to ministers of religion
- (f) Fees to members of boards of directors
- (g) Holidays and paid vacation or sick leave.

Also included is the cost to the employer of providing food, lodging, ordinary clothing etc. either free of cost, or at a markedly reduced cost which are of clear and direct benefit to the employees as consumers.

Excluded from wages and salaries are expenditure by employers which are of benefit both to the employees and the employers. Examples of these are outlays on:

- (a) Medical Examinations
- (b) Sport and other recreational facilities
- (c) Amenities at place of work
- (d) Reimbursement of expenses for travel and entertainment
- (e) Reimbursement of expenses or provision of uniforms, tools and equipment.

(2) Employers Contribution to Social Security Schemes: This concept is self explanatory.

(3) Employers contribution to Private Pension Funds etc. This is defined as contributions to private funds, reserves or other special schemes in respect of family allowances, lay-off and severance pay, casualties and maternity leave, pensions etc.

The SNA states that if in the absence of special schemes of reserves, employers make direct payments of this type to their employees, imputed contributions in respect of these obligations should be included in the employers contribution to private schemes.

II THE OPERATING SURPLUS:

This is equivalent to the excess of the value added at producer's prices over the sum of compensation of employees, indirect taxes net of subsidies and allowances for the consumption of fixed capital. If strict income approach to estimating value added is used, operating surplus is estimated directly and value added is computed as the difference between gross output and intermediate consumption and operating surplus is calculated as the residual between value added and its other components. Operating surplus is simply the sum of net profits and property income.

When estimates of operating surplus of establishments are derived from data on profits shown in the accounts of enterprises, care has to be taken to adjust these data, as necessary, to the national accounts definition. If the figures from the accountants of enterprises, relate to profits before taxes, it is necessary to adjust them to remove any property incomes - interest, rent on land, royalties, etc. - and transfers paid and received - grants to institutions and individuals, investments, subsidies and grants - and capital gains and losses reflected in the figures.

III THE GROSS OUTPUT OF INDUSTRIES:

This is equal to the gross value of the commodities (the goods and services) they produce during the period. In the case of units producing for the market most of the goods produced during a period are usually sold during the same period. The rest goes into the stocks of the producers either in the form of finished goods or as work-in-progress. Work-in-progress includes partially processed, fabricated or assembled goods, but excludes partially completed construction works, which are included in gross fixed capital formation and in the sales of the construction industry. The increase in the value of standing timber and crops which is due to growth is excluded from gross output and work-in-progress. Goods and services produced which are not intended for sale in the market, but are used for consumption or capital formation on own account, should also be covered in the gross output of industries.

IV INTERMEDIATE CONSUMPTION:

This is made up of the purchases of goods and services on current account reduced by sales less purchases of similar second-hand goods. The goods are valued at purchaser's values at the moment of use. For Government, durable goods acquired primarily for

military purposes are treated as intermediate consumption. It should be noted that family dwellings for military personnel are not treated as a part of Government consumption but as public sector investment. The durable goods purchased for civil defense, and for military hospitals, schools, airport and roads, etc. when given for civilian use, are not part of Government consumption but are treated as fixed capital formation.

Payments in kind of wages and salaries of such items of housing, food or clothing as in the case of industries are not treated as being the intermediate consumption of these institutions, but included as part of compensation of employees, and therefore, become part of final consumption of households.

V CONSUMPTION OF FIXED CAPITAL:

This is defined as the value at current replacement cost of the reproducible fixed assets except the roads, dams and other forms of construction excluding structures of the producers of government services used up during a period of account as a result of normal wear and tear, foreseen obsolescence and the normal rate of accidental damage, unforeseen obsolescence, major catastrophes and the depletion of natural resources are not taken into account.

VI INDIRECT TAXES:

These are defined as compulsory payments to Government which industries treat as part of the cost of production. They include import and export duties, excise, sales, entertainment and turnover taxes, real estate and land taxes, unless they are merely an administrative device for collecting income tax, levies on value added and the employment of labour (but not social security contributions), motor vehicle, driving test, licence, airport and passport fees when paid by producers, but are considered to be compulsory fees, fines and penalties when paid by the Household Sector.

VII SUBSIDIES:

These are all grants on current account made by Government to private industries and public corporations, and grants made by the public authorities to Government enterprises in compensation for operating losses, when these losses are clearly the consequences of the policy of the Government to main prices at a level below cost of production.

Any Government grants to producers which are not connected with their productive activities but are given to them in the capacity of customers, such as social assistance grants and social security benefits should be treated as current transfers and not as subsidies.

VIII GOVERNMENT FINAL CONSUMPTION:

This is defined as the gross output of producers of Government services less the value of Government sales and the value of its own-accounts capital formation. The gross output is equal to the cost of production, that is, the sum of intermediate consumption of goods and services, compensation of employees, consumption of fixed capital and direct taxes paid.

The Government final consumption expenditure, consists therefore of the purchase of goods and services, and expenditures on compensation of employees less the revenue received from sales. Sales do not include fees and charges that are levied by Governments for regulatory purposes. Examples are payments of driving tests, vehicle licences, driving permits, dog licences, passports, airport fees and fees charged for court services, all of which are defined as fees when paid by households and as indirect taxes when paid by enterprises. Fines and penalties are also excluded from sales and classified as "fines and penalties" whether paid by households or enterprises. These items are not to be deducted from gross output to arrive at final consumption expenditure.

IX GROSS FIXED CAPITAL FORMATION:

This consists of additions to the assets of producers of tangible reproducible goods which have an expected lifetime of use of one year or more. The producers in question may be industries, producers of Government services and producers of private non-profit services to households. The capital goods may be purchased or produced on own account. Sales less purchases of second-hand fixed assets and sales of scrapped fixed assets by producers should be deducted from gross fixed capital formation. Gross fixed capital formation covers the following items:

- (i) Acquisitions by producers for civilian use of tangible assets which have an estimated lifetime of use of one year or more, except land, mineral deposits, timber tracts and similar non-reproducible tangible assets. Relatively inexpensive durable reproducible goods, such as certain types of office equipment, may on practical grounds be excluded. Government outlays on construction and machinery and durable equipment primarily intended for military use, are classified as intermediate consumption rather than gross fixed capital formation.
- (ii) Outlays on improvements and alterations of capital goods which significantly extend their expected lifetime of use or substantially increase their productivity are considered to be gross fixed capital formation.

goods and services which it has received from other units, at home or abroad.

XIII GROSS DOMESTIC PRODUCT AT MARKET PRICES:

This is equal to GDP at factor cost plus indirect taxes less subsidies.

XIV GNP AT MARKET PRICES:

GNP at market prices is the value of the goods and services produced by the labour and capital supplied by normal residents of a country. It is derived by adding net factor income from the rest of the world to GDP at market prices.

XV NET FACTOR INCOME FROM THE REST OF THE WORLD:

This is defined as the sum of two major components, net compensation of employees, and net property and entrepreneurial income. Net compensation of employees covers the labour income of residents abroad and non-residents in the country. Net property and entrepreneurial income covers investment income from ownership of foreign financial claims such as interest, dividends, and non-financial property income such as patents, copyrights, etc. The entrepreneurial income of foreign investment in a country, i.e. profits and dividends, could be remitted to foreign countries or left unremitted. The unremitted position is always treated as reinvested earnings.

XVI LABOUR INCOME AND WORKER'S REMITTANCES:

It should be noted that there is a distinction between those individuals whose earnings are to be classified as labour income (persons who are not residents of the economy where they work) and migrants (persons who have become residents of that economy by virtue of being expected to live there for a year or more). This distinction is often hard to make in practice. Data for these items are generally obtained from the balance of payments accounts, where migrants' income is classified as workers' remittances under unrequitted transfers. Often when the distinction cannot be made labour income is aggregated with workers' remittances.

XVII NATIONAL ACCOUNTS AT CONSTANT PRICES:

For analytical purposes, the national accounts at constant prices are derived by breaking current values down into a price component and quantity component. Estimates at constant prices are usually derived by deflating the values by price indices or by extrapolating base year values by appropriate volume indices. Both are equivalent to expressing current period quantities at base period prices.

- (iii) Outlays on the reclamation and improvement of land, on the development and extension of timber tracts, mines, plantations, orchards, and similar agricultural holdings are included in gross fixed capital formation.
- (iv) Purchases and breeding of draught animals, breeding stock, dairy cattle and sheep and other animals raised for wool and hair clips should be treated as acquisitions of fixed assets.
- (v) Dealers' margins, solicitors' fees, stamp duties and other transfer costs of transactions in land, mineral deposits, timber tracts and similar non-reproducible assets in tangible non-financial assets and in second-hand assets are covered in gross capital formation.

X INCREASE IN STOCKS:

This is equal in principle to the market value at the owning establishment of the physical change during a period of account in stocks of materials, supplies, work-in-progress except on construction projects, finished products, livestock raised for slaughter and merchandise held by resident industries and in stock of strategic materials and emergency stocks of important products held by Government services. In practice, the closest feasible approximation may be the difference between the levels of these stocks at the beginning and end of the period, both valued at approximate average prices ruling over the period.

XI EXPORTS AND IMPORTS OF GOODS AND NON-FACTOR SERVICES:

This consists of the transactions of the residents of a given country with the rest of the world, and covers merchandise, transportation, travel, insurance and other non-factor services, such as Government transactions, various fees, rentals, royalties, gifts in kind etc. Military equipment transferred between Governments may, however, go unrecorded. Expenditure abroad by residents such as tourists and other persons, seasonal workers, and diplomatic and military personnel stationed abroad are treated as imports. Similarly, expenditures in the domestic territory by non-residents are considered exports. The valuation of exports is f.o.b., while the valuation of imports is c.i.f.

XII GROSS DOMESTIC PRODUCT AT FACTOR COST:

This is pertains to the value of all goods and services produced in an economy within a time period of usually one year. It is equal to the sum of compensation of employees, consumption of fixed capital and operating surplus. An over-riding consideration on measuring the value of a country's gross domestic product is that duplication must be avoided. Duplication is avoided by deducting from the output of each producing unit the value of the inputs of

XVIII METHODOLOGY OF ESTIMATING GROSS DOMESTIC PRODUCT:

The value added can be estimated by three different approaches, which are generally called the production approach, the income approach and the expenditure approach.

The production approach is designed to evaluate the value of output. The value is estimated by deducting intermediate consumption from the value of output. The production approach is useful for estimation of value added for the commodity producing sectors, viz. agriculture, livestock, forestry, fishing and mining.

The income approach is used to estimate the value added by aggregating compensation of employees, operating surplus and consumption of fixed capital. This approach is most commonly used in the case of service sectors, since data on gross output and intermediate consumption in the service sectors may not be readily available.

The expenditure approach, is used to estimate the gross domestic product according to categories of final use. This consists of estimates of expenditure of final consumption of households, consumption expenditure of Government, private non-profit services serving households and gross capital formation adjusted for imports and exports of goods and service.

NOTES ON METHODOLOGY

AGRICULTURE

This sector comprises of crops, livestock, forestry and fishing.

CROPS

Estimates on production from crops cover output of thirty one different crops of which bananas are the principle crop accounting for about 20% of total agricultural production at farm-gate prices. Other important agro-industrial crops are coconuts, grapefruits, limes, oranges and bay oil.

Value added is estimated by the production approach. The value of output consists of exports and local consumption, including subsistence, which vary from crop to crop. The output of the various crops are estimated in consultation with the Ministry of Agriculture. The farm-gate prices are obtained by adjusting export f.o.b. and market prices for trade and transport margins. These prices are checked for consistency with prices paid by Banana Growers Association, and Dominica Coconut Products to the banana and coconut growers, and those paid by Dominica Agricultural Marketing Board for several other crops.

The cost of material inputs consists of imported inputs such as seeds, fertilizers, pesticides and insecticides. The c.i.f. value of these imports are adjusted upwards to include duty, consumption tax and trade and transport margins. Additionally, in consultation with the Ministry of Agriculture, local inputs of materials and costs of repairs and maintenance of agricultural machinery and tools are estimated at 10% of the value of output. The double deflation method is used to obtain the 1977 constant prices. Production of all agricultural crops are revalued at 1977 prices. Imported inputs are deflated by an index of potassic fertilizer prices, and local inputs are taken to be 10% of constant price outputs.

LIVESTOCK

The value added for livestock is estimated by the production approach. The livestock Division of the Ministry of Agriculture provides estimates of beef, pork, mutton, poultry, meat, eggs and milk production. Estimates of meat production are based on slaughter permits and an upward adjustment is made for unrecorded slaughter. Estimates on poultry and egg production are obtained from the major poultry farms. These are cross-checked for consistency with the estimates provided by the Ministry of Agriculture. Material inputs consist mostly of imported livestock feed which amounts to about 25% of the gross value of output. Local inputs are estimated at 5% of output. The constant series is obtained by the double deflation method.

ELECTRICITY AND WATER

The value added in this sector is estimated by the income approach. The main source of data are the accounts of the Dominica Electricity Services and the Water Supply Authority. The constant price estimates are extrapolated from the base year estimates on the basis of electricity sold and water supply.

CONSTRUCTION

The value added in construction is estimated by the commodity flow approach. The estimates are essentially based on imports data, since domestic output of construction material is negligible. The c.i.f. values of imports of construction material are adjusted downwards for any re-exports and for non-construction purposes; and adjusted upwards for duty, consumption tax, trade and transport margins. The value of construction materials used as inputs is assumed to be 65% of the gross value of output. This proportion has been derived on the basis of discussions with the Ministry of Communications and Works and private contractors. For the constant price estimates, the deflator used is an index of c.i.f. import prices of construction materials (based on SITC Rev.2 section 6 and 2).

WHOLESALE AND RETAIL TRADE

Value added in the trade sector is estimated by the income approach. The main source of data are the accounts of trading establishments available at the Inland Revenue Office. For non-response, adjustments are made on the basis of data on employment and remuneration available from the Social Security Department. The small traders (self-employed) and vendor trade are assumed to be a very small percentage of the total. The constant price estimates have been obtained by extrapolating the base year estimate by an index of traded goods valued at 1977 prices, covering outputs of Agriculture, Mining and Manufacturing sectors and imports.

HOTELS AND RESTAURANTS

The value added estimates are obtained by the income approach. The main sources of data are the accounts at the Inland Revenue Office. To cover small hotels and restaurants the above is adjusted by 5%. The constant price estimates are derived by extrapolating the base year value added by an index of the total number of visitor arrivals.

TRANSPORT

The transport sector comprised of road transport, water transport and air transport.

FORESTRY

The value of output covers bamboo, wood, firewood and charcoal. The estimates are obtained in consultation with the Ministry of Agriculture Forestry Department. Material inputs are estimated at 20% of gross value of output. The constant price series is obtained by the double deflation method.

FISHING

For fishing, the Ministry of Agriculture Fisheries Division provided estimates of landed catch. Since December 1983, enumerators from the Ministry are collecting detailed monthly data on catch at major fishing ports. Data are also obtained from the cooperatives. For the previous years, output has been estimated on the basis of number of mechanized and non-mechanized boats and average catch per boat. The Department of Fisheries conducted an ad hoc survey in 1981 and estimated that there were 350 mechanized and 259 non-mechanized boats in fishing and they caught 8,000 lbs and 2,080 lbs of fish per boat respectively. The retail price of fish is taken as the producers' price since most of the fish is usually sold at the point of landing. The material inputs consist of expenses on fuel, bait, nets, repairs and maintenance of boats, etc. which amounts to 48.7% of the value of output for mechanized boats and 5.2% for non-mechanized boats. The constant price estimates are obtained by valuing output at 1977 prices and deducting input in the same proportion as in the current series.

MINING AND QUARRYING

This is a relatively small sector and consists of only one private company and the government engaged in quarrying. The output covers production of gravel, stone, pumice and sand. Due to the lack of more comprehensive data for this sector, in recent years the value in Mining has been assumed to be about 10% of the value in construction in both current and constant prices.

MANUFACTURING

Value added in the Manufacturing sector is estimated by the income approach. The main source of data is the Inland Revenue Office. The available income tax returns are analyzed and data on wages and salaries, interest, rent, depreciation and profits, which constitute the value added, are compiled. The non-response is estimated on the basis of data on wages and salaries available from the Social Security Department. The contribution of the small scale industries and handicrafts are assumed to be 10% of the total value added. The constant price estimates are worked out by extrapolating the base year estimate on the basis of quantities of manufacturing output.

ROAD TRANSPORT

The estimates of value added are obtained on the basis of earnings per vehicle and number of vehicles. The vehicles covered are hired trucks, buses, taxis, and hired jeeps, and their number is obtained from the licensing authorities. The earnings per vehicle are obtained on the basis of inquiries from various operators. The constant price estimates are extrapolated by the number of vehicles in each category.

WATER TRANSPORT

The income approach is used to derive value added estimates for water transport, which are obtained from the accounts of port authority, shipping agents and lighter owners, and private shipping companies. The constant price estimates are derived on the basis of volume of cargo traffic.

AIR TRANSPORT

This sector covers LIAT, air travel and airport administration. The income of travel agents and airport administration have been obtained from their accounts, and 5% of LIAT's operating surplus is being included representing the share of equity capital held by Dominica. The constant price estimates are based on the index of volume of passenger arrivals.

COMMUNICATIONS

The estimates cover the operations of the Post Office and Cable and Wireless. The accounts of the Post Office which are available from the Government budget are analyzed to obtain compensation of employees and the constant price estimates are based on the volume of postal traffic. The accounts of Cable and Wireless for Dominica's operation are analyzed to obtain the value added in current prices. The constant price estimates are based on the number of minutes of overseas calls.

BANKING AND INSURANCE

The value added estimates are obtained by the income approach. The accounts of 5 commercial banks, 22 credit unions and insurance companies are analyzed to obtain the data. For the banking sub-sector, the constant price estimates are based on a combined index of cheques cleared and employment (50:50 weights), and for insurance the deflator used is the Consumer Price Index.

REAL ESTATE AND DWELLINGS

The value added estimates for owner-occupied dwellings are calculated on the basis of number of houses and average rent per house. One month's rent is subtracted as cost of repairs and maintenance. The number of dwellings is projected on the basis of

1970 and 1981 population census data on housing and the growth of the population. The rate of rent per house for the island as a whole is assumed to be half of the low cost housing as most of the houses are of low quality. The value added at constant prices are derived first with population growth, and then inflated by the total Consumer Price Index to obtain current price estimates. The constant price value added for 1979 has been adjusted downwards on account of destruction of houses by Hurricane David. The Roseau Market Authority is engaged in real estate. The contribution to value added is very small as is based on compensation of employees.

GOVERNMENT SERVICES

The value added at current prices are obtained from analysis of the data on actual expenditure available from the computer printouts. The wages and salaries, pensions and gratuities comprise compensation of employees. The operations of the post office, airport, broadcasting and construction are excluded and allocated to their appropriate sectors. The major accounts in the government thus refer to central government, local government and Social Security Administration. Fiscal year data of central and local governments are adjusted to correspond to the calendar year. The constant price estimates are obtained by eliminating the effect of wage increase due to cost of living.

OTHER SERVICES

This sector covers business, entertainment and personal services, such as services of accounting firms, legal firms, individual professionals, domestic maids, barbers and beauty salons etc. Broadcasting and recently Cable TV have also been included. The data are based on a benchmark estimate compiled for 1977-1978 from the Inland Revenue Office accounts and Social Security data on employment and remuneration. The constant price series is derived on the basis of population growth, and the current price series obtained by inflating the above with the Consumer Price Index.

IMPUTED BANKING SERVICE CHARGES

According to the recommendation of the UN SNA, the imputed banking service charges, which consists of the difference between interest earned on loans and interest paid on deposits, have been deducted from the GDP in a single line, and not allocated to individual sectors. The constant price estimates are obtained by extrapolating the base year figure with an index of cheques cleared and employment (50:50 weights) as was the case for the Banking Sector.

ANALYSIS OF THE PERFORMANCE OF THE DOMINICA ECONOMY FOR 1993

(The Dominica Economy grows by 1.8 percent)

OVERVIEW:

The Dominica economy grew by 1.8% in real terms in 1993, despite a 1.7% drop within the agriculture sector. At the same time, there was steady growth within the Hotels and Restaurant sector (12.6%), the Communications sector (5%), the Banking and Insurance sector (2%) and the Construction sector (4%).

The rate of inflation as measured by the Consumer Price Index (CPI) stood at 1.6%, the lowest level in well over twenty years. Export earnings were estimated to have dropped by about five percent whilst import levels increased only marginally by about one percent. At the same time, visitor arrivals (excluding cruiseship visitors) into Dominica increased by 5.2 percent with cruiseship visitors falling slightly by 2.2 percent.

CONSUMER PRICES:

A 1.6 percent increase was recorded in the Consumer Price Index in 1993 over 1992, the lowest for more than two decades. Throughout the year the monthly movements in the All Items Index were either negative or reflected increases of less than 1 percent. In June, a high of 3.61 percent was registered as a result of an unusual increase in the food group index particularly the vegetables and fruits sub-group.

Between July 1984 and July 1993, 50 to 90 percent price increases were noted in such items as beef, tuna, cheese, redbeans, cigarettes, women casual shoes and television fees. Over 100 percent increases were noted in salted fish, whisky, water rates, women dresses and doctors fees. Over 200 percent increases were recorded in carrots and pre-school fees. Chicken wings, eggs, rum, kerosene, petrol and refrigerators were among the items reflecting increases of less than 10 percent.

AGRICULTURE SECTOR:

The agriculture sector was the only sector within the Dominica economy to register negative real growth in 1993. This was largely as a result of the drop in production within the dominant banana industry. The level of banana exports by the Dominica Banana Marketing Corporation fell by 4.2% from 57,938 tonnes in 1992 to 55,486 tonnes in 1993. This, coupled with an average 14.3 percent drop in the green wholesale price of bananas led to a 16.6 million drop in export revenue from EC\$ 82.03 million in 1992 to EC\$ 65.42 million in 1993.

Overall output within the agriculture sector declined by 2.2 percent with Agriculture's contribution to GDP for 1993 standing at 23.49%.

The livestock, forestry and fishing sectors contributed 1.68%, 0.79% and 1.75% respectively to real GDP.

HOTEL AND RESTAURANT SECTOR:

Activity within the tourism sector is largely reflected in changes in the hotel and restaurant sector and as such, this is sometimes used as a proxy in estimating tourism contribution to overall GDP. For the year under review, the contribution of the hotel and restaurant sector to real GDP was 2.6 percent. In addition, the sector recorded the largest increase in real GDP among the other sectors of the economy growing by 12.6 percent when compared to 1992.

The number of tourist arrivals (stay-over visitors) into Dominica increased by 11 percent in 1993, moving from 46,959 arrivals in 1992 to 52,200 in 1993. Fifty-six percent of tourist arrivals originated from the caribbean region with twenty-eight percent coming from the French West Indies. Europe accounted for twenty-two percent whilst sixteen percent came from the United States.

During 1993, cruiseship arrivals into Dominica fell to 87,836 visitors from 215 calls compared to 90,049 visitors from 193 calls in 1992. At the same time, total visitor arrivals (excluding cruiseship visitors) was recorded at 57,539 in 1993 compared to 55,211 in 1992.

MANUFACTURING:

Real growth of 1.5 percent was recorded within the manufacturing sector for 1993. This put the overall contribution of this sector to GDP at 7.6 percent which equalled the contribution in 1992. Most of this growth was registered within soap manufacture, toiletries, paint, furniture and shoe manufacture.

CONSTRUCTION, MINING AND QUARRYING:

The number of construction starts at the end of 1993 stood at 182 with a value of EC\$32.8 million compared with 189 and a value of EC\$29.8 million in 1992. Construction permits issued by the Housing authority increased from 543 with a value of EC\$85.3 million in 1992 to 556 and a value of EC\$105.9 million in 1993. At the same time, the percentage contribution of construction to real GDP was 7.5 percent growing at a rate of four percent in 1993 following the negative growth of just under one percent in 1992.

Mining and quarrying generally kept pace with the stepped up level of construction activity throughout the Island. Activity within this sector grew by 4.1 percent and pushed the overall contribution to GDP to 0.77 percent. Prices of aggregate generally remained steady during 1993.

BANKING AND INSURANCE:

This sector is the third largest contributor to GDP after agriculture and government. The overall contribution to GDP in 1993 stood at 12.3 percent which equalled the 1992 contribution. The financial institutions increased their lending to manufacturing concerns, the distributive trades, the tourism sector as well as personal loans for house and land purchases. Rates for the various types of insurance generally remained at the 1992 level and increased activity was recorded within that sector for the period under review.

ELECTRICITY AND WATER:

During 1993, the percentage contribution of this sector to real GDP was 3.39 percent with a growth rate of 1.98 percent. Electricity generated in 1993 was up 5 percent over the 1992 level. A rise in the number of first time users would have impacted positively on the level of consumption. At the same time, consumers benefitted from a much reduced fuel surcharge. Water consumption by domestic households was on the rise.

TRANSPORT AND COMMUNICATION:

The percentage contribution of this sector to real GDP in 1993 was estimated at 17.9 percent with a growth rate of 7.9 percent over 1992. The communication sector continues to expand appreciably within the domestic economy with an increasing use by the populace of telecommunication facilities. Increased visitor arrivals into Dominica and the expansion of carrier services, contributed favorably to air transport growth in 1993.
