## PREFACE

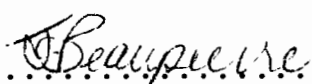

This is the eighth publication on National Accounts issued by the Central Statistical Office. This issue provides estimates of **Gross Domestic Product** in current and constant prices at factor cost, and also of expenditure on GDP at current prices, Gross National Disposable Income, Appropriation and Capital Finance. Additionally, it includes the **Balance of Payments** components from 1987 to 1996. The accounts of Central Government as well as government enterprises and some key economic indicators are also included.

In presenting this report, the standard methodology adopted for the OECS countries which is broadly consistent with the revised United Nations **System of National Accounts (SNA)** has been used. However, due to serious manpower constraints and other pertinent problems, the scope of the series has been greatly restricted. Consequently, a number of the tables which have been recommended in the SNA are not here presented. Compilation of the Balance of Payments estimates which is undertaken with assistance from the Eastern Caribbean Central Bank follows standard procedures recommended by the International Monetary Fund's (IMF) fifth edition Balance of Payment Manual.

The material presented in this issue consists of revised National Accounts estimates for the period 1983 to 1995 and preliminary estimates for 1996. Substantial revisions were made to the series to incorporate the new base year of 1990. Previously, 1977 was used as the base year. In the process of revising the series, some changes were made to a few of the deflators as a means of improving on the quality of the estimates. Also, revised Balance of Payments estimates are presented from 1987 to 1995 and preliminary estimates for 1996. Heavy reliance is being placed on an annual survey of establishments which provides most of the source data for the compilation of these statistics.

The Central Statistical Office expresses sincere thanks to the many establishments which continually provide us with the relevant data. In addition, the services rendered by **Mrs. Hazel Corbin** and **Miss Miriam Blanchard** of the ECCB and **Miss Cisne Pascal** of the International Business Unit have gone a long way in finalizing the National Accounts and Balance of Payments statistics.

**DEFINITION OF COMPONENTS OF  
THE ACCOUNTS AND RELATED AGGREGATES**

**I. COMPENSATION OF EMPLOYEES:**

This is defined to include all payments by resident producers of wages and salaries to their employees in cash and in kind, and of contributions paid or imputed, in respect of their employees, to social security schemes and to private pensions, family allowance, casualty insurance, life insurance and similar schemes.

(1) Wages and Salaries: This is defined to include all payments which employees receive in respect of their work whether in cash or in kind, and before deductions to Social Security, Income Tax, etc. Included are:

- (a) Commissions
- (b) Tips
- (c) Bonuses
- (d) Cost of living and dearness allowances
- (e) Fees to ministers of religion
- (f) Fees to members of boards of directors
- (e) Holidays and paid vacations of sick leave

Also included is the cost to the employer of providing food, lodging, ordinary clothing etc, either free of cost, or at a markedly reduced cost which are of clear and direct benefit to the employees as consumers.

Excluded from wages and salaries are expenditure by employers which are of benefit both to the employees and the employers. Examples of these are outlays on:

- (a) Medical Examinations
  - (b) Sport and other recreational facilities
  - (c) Amenities at place of work
  - (d) Reimbursement of expenses for travel and entertainment
  - (e) Reimbursement of expenses or provision of uniforms, tools and equipment.
- (2) Employers Contribution to Social Security Schemes:  
This concept is self explanatory.
- (3) Employers contribution to Private Pension Funds etc  
This is defined as contributions to private funds, reserves or other special schemes in respect of family allowances, lay-off and severance pay, casualties and maternity leave, pensions etc.

The SNA states that if in the absence of special schemes of reserves, employers make direct payments of this type to their

employees, imputed contributions in respect of these obligations should be included in the employers contribution to private schemes.

## **II. THE OPERATING SURPLUS:**

This is equivalent to the excess of the value added at producer's prices over the sum of compensation of employees, indirect taxes net of subsidies and allowances for the consumption of fixed capital. If strict income approach to estimating value added is used, operating surplus is estimated directly and value added is computed as the difference between gross output and intermediate consumption and operating surplus is calculated as the residual between value added and its other components. Operating surplus is simply the sum of net profits and property income.

When estimates of operating surplus of establishments are derived from data on profits shown in the accounts of enterprises, care has to be taken to adjust these data, as necessary, to suit the national accounts definition. If the figures from the accountants of enterprises, relate to profits before taxes, it is necessary to adjust them to remove any property incomes - interest, rent on land, royalties, etc. - and transfers paid and received - grants to institutions and individuals, investments, subsidies and grants - and capital gains and losses reflected in the figures.

## **III. THE GROSS OUTPUT OF INDUSTRIES:**

This is equal to the gross value of the commodities (the goods and services) they produce during the period. In the case of units produced for the market, most of the goods produced during a period are usually sold during the same period. The rest goes into the stocks of the producers either in the form of finished goods or as work-in-progress. Work-in-progress includes partially processed, fabricated or assembled goods, but excludes partially completed construction works, which are included in gross fixed capital formation and in the sales of the construction industry. The increase in the value of standing timber and crops which is due to growth is excluded from gross output and work-in-progress. Goods and services produced which are not intended for sale in the market, but are used for consumption or capital formation on own account, should also be covered in the gross output of industries.

## **IV. INTERMEDIATE CONSUMPTION:**

This is made up of the purchases of goods and services on current account reduced by sales less purchases of similar second-hand goods. The goods are valued at purchaser's values at the moment of use. For Government, durable goods acquired primarily for military purposes are treated as intermediate consumption. It should be noted that family dwellings for military personnel are not treated as a part of Government consumption but as public sector investment. The durable goods purchased for civil defense, and for military hospitals, schools, airport and roads, etc. when

given for civilian use, are not part of Government consumption but are treated as fixed capital formation.

Payments in kind of wages and salaries of such items of housing, food or clothing as in the case of industries are not treated as being the intermediate consumption of these institutions, but included as part of compensation of employees, and therefore, become part of final consumption of households.

#### **V      CONSUMPTION OF FIXED CAPITAL:**

This is defined as the value at current replacement cost of the reproducible fixed assets except the roads, dams and other forms of construction excluding structures of the producers of government services used up during a period of account as a result of normal wear and tear, foreseen obsolescence. Major catastrophes and the depletion of natural resources are not taken into account.

#### **VI     INDIRECT TAXES:**

These are defined as compulsory payments to Government which industries treat as part of the cost of production. They include import and export duties, excise, sales, entertainment and turnover taxes, real estate and land taxes, unless they are merely an administrative device for collection income tax, levies on value added and the employment of labour (but not social security contributions), motor vehicle, driving test, license, airport and passport fees when paid by producers, but are considered to be compulsory fees, fines and penalties when paid by the Household sector.

#### **VII    SUBSIDIES:**

These are all grants on current account made by Government to private industries and public corporations, and grants made by the public authorities to Government enterprises in compensation for operating losses, when these losses are clearly the consequences of the policy of the Government to maintain prices at a level below cost of production.

Any Government grants to producers which are not connected with their productive activities but are given to them in the capacity of customers, such as social assistance grants and social security benefits should be treated as current transfers and not as subsidies.

#### **VIII. GOVERNMENT FINAL CONSUMPTION**

This is defined as the gross output of producers of Government services less the value of Government sales and the value of its own-accounts capital formation. The gross output is equal to the cost of production, that is, the sum of intermediate consumption of fixed capital and direct taxes paid.

The Government final consumption expenditure, consists therefore of the purchase of goods and services, and expenditures on compensation of employees less the revenue received from sales. Sales do not include fees and charges that are levied by Governments for regulatory purposes. Examples are payments of driving tests, vehicle licenses, driving permits, dog licenses, passports, airport fees and fees charged for court services, all of which are defined as fees when paid by households and as indirect taxes when paid by enterprises. Fines and penalties are also excluded from sales and classified as "fines and penalties" whether paid by households or enterprises. These items are not to be deducted from gross output to arrive at final consumption expenditure.

#### **IX. GROSS FIXED CAPITAL FORMATION:**

This consists of additions to the assets of producers of tangible reproducible goods which have an expected lifetime of use of one year or more. The producers in question may be industries, producers of Government services and producers of private non-profit services to households. The capital goods may be purchased or produced on own account. Sales less purchases of second-hand fixed assets and sales of scrapped fixed assets by producers should be deducted from gross fixed capital formation. Gross fixed capital formation covers the following items:

- (i) Acquisitions by producers of civilian use of tangible assets which have an estimated lifetime of use of one year or more, except land, mineral deposits, timber tracts and similar non-reproducible tangible assets. Relatively inexpensive durable reproducible goods, such as certain types of office equipment, may on practical grounds be excluded. Government outlays on construction and machinery and durable equipment primarily intended for military use, are classified as intermediate consumption rather than gross fixed capital formation.
- (ii) Outlays on improvements and alterations of capital goods which significantly extend their expected lifetime of use of substantially increase their productivity are considered to be gross fixed capital formation.
- (iii) Outlays on the reclamation and improvement of land, on the development and extension of timber tracts, mines, plantations, orchards, and similar agricultural holdings are included in gross fixed capital formation.

- (iv) Purchases and breeding of draught animals, breeding stock, dairy cattle and sheep and other animals raised for wool and hair clips should be treated as acquisitions of fixed assets.
- (v) Dealer's margins, solicitors' fees, stamp duties and other transfer costs of transactions in land, mineral deposits, timber tracts and similar non-reproducible assets in tangible non-financial assets and in second-hand assets are covered in gross capital formation.

#### **X INCREASE IN STOCKS:**

This is equal in principle to the market value at the owing establishment of the physical change during a period of account in stocks of materials, supplies, work-in-progress except on construction projects, finished products, livestock raised for slaughter and merchandise held by resident industries and in stock of strategic materials and emergency stocks of important products held by Government services. In practice, the closest feasible approximation may be the difference between the levels of these stocks at the beginning and end of the period, both valued at approximate average prices ruling over the period.

#### **XI EXPORTS AND IMPORTS OF GOODS AND NON-FACTOR SERVICES:**

This consists of the transactions of the residents of a given country with the rest of the world, and covers merchandise, transportation, travel, insurance and other non-factor services, such as Government transactions, various fees, rentals royalties, gifts in kind etc. Military equipment transferred between Governments may, however, go unrecorded. Expenditure abroad by residents such as tourists and other persons, seasonal workers, and diplomatic and military personnel stationed abroad are treated as imports. Similarly, expenditures in the domestic territory by non-residents are considered exports. The valuation of exports is f.o.b., while the valuation of imports is c.i.f.

#### **XII GROSS DOMESTIC PRODUCT AT FACTOR COST:**

This pertains to the value of all goods and services produced in an economy within a time period of usually one year. It is equal to the sum of compensation of employees, consumption of fixed capital and operating surplus. An over-riding consideration on measuring the value of a country's gross domestic product is that duplication must be avoided. Duplication is avoided by deducting from the output of each producing unit the value of the inputs of goods and services which it has received from other units, at home or abroad.

### **XIII GROSS DOMESTIC PRODUCT AT MARKET PRICES :**

This is equal to GDP at factor cost plus indirect taxes less subsidies.

### **XIV GNP AT MARKET PRICES:**

GNP at market prices is the value of the goods and services produced by the labour and capital supplied by normal residents of a country. It is derived by adding net factor income from the rest of the world to GDP at market prices.

### **XV NET FACTOR INCOME FROM THE REST OF THE WORLD:**

This is defined as the sum of two major components, net compensation of employees, and net property and entrepreneurial income. Net compensation of employees covers the labour income of residents abroad and non-residents in the country. Net property and entrepreneurial income covers investment income from ownership of foreign financial claims such as interest, dividends, and non-financial property income such as patents, copyrights, etc. The entrepreneurial income of foreign investment in a country, i.e. profits and dividends, could be remitted to foreign countries or left unremitted. The unremitted position is always treated as reinvested earnings.

### **XVI LABOUR INCOME AND WORKER'S REMITTANCES:**

It should be noted that there is a distinction between those individuals whose earnings are to be classified as labour income (persons who are not residents of the economy where they work) and migrants (persons who have become residents of that economy by virtue of being expected to live there for a year or more). This distinction is often hard to make in practice. Data for these items are generally obtained from the balance of payments accounts, where migrants' income is classified as workers' remittances under unrequited transfers. Often when the distinction cannot be made labour income is aggregated with workers' remittances.

### **XVII NATIONAL ACCOUNTS AS CONSTANT PRICES:**

For analytical purposes, the national accounts at constant prices are derived by breaking current values down into a price component and quantity component. Estimates at constant prices are usually derived by deflating the values by price indices or by extrapolating base year values by appropriate volume indices. Both are equivalent to expressing current period quantities at base period prices.

#### **XVIII METHODOLOGY OF ESTIMATING GROSS DOMESTIC PRODUCT:**

The value added can be estimated by three different approaches, which are generally called the production approach, the income approach and the expenditure approach.

**The production approach**, is designed to evaluate the value of output. The value is estimated by deducting intermediate consumption from the value of output. The production approach is useful for estimation of value added for the commodity producing sectors, viz. agriculture, livestock, forestry, fishing and mining.

**The income approach**, is used to estimate the value added by aggregating compensation of employees, operating surplus and consumption of fixed capital. This approach is most commonly used in the case of service sectors, since data on gross output and intermediate consumption in the service sectors may not be readily available.

**The expenditure approach**, is used to estimate the gross domestic product according to categories of final use. This consists of estimates of expenditure of final consumption of households, consumption expenditure of Government, private non-profit services serving households and gross capital formation adjusted for imports and exports of goods and service.

## **NOTES ON METHODOLOGY**

### **AGRICULTURE**

This sector comprises of crops, livestock, forestry and fishing.

#### **CROPS**

Estimates on production from crops cover output of thirty one different crops of which bananas are the principles crop accounting for about 20% of total agricultural production at farm-gate prices. Other important agro-industrial crops are coconuts, grapefruits, limes, oranges and root crops-such as yams, dasheens and tannias.

Value added is estimated by the production approach. The value of output consists of exports and local consumption, including subsistence, which vary from crop to crop. The output of the various crops are estimated in consultation with the Ministry of Agriculture. The farm-gate prices are obtained by adjusting export f.o.b. and market prices for trade and transport margins. These prices are checked for consistency with prices paid by Dominica Banana Marketing Corporation, and Dominica Coconut Products to the banana and coconut growers.

The cost of material inputs consists of imported inputs such as seeds, fertilizers, pesticides and insecticides. The c.i.f. value of these imports are adjusted upwards to include duty, consumption tax and trade and transport margins. Additionally, in consultation with the Ministry of Agriculture, local inputs of materials and costs of repairs and maintenance of agricultural machinery and tools are estimated at 10% of the value of output. The double deflation method is used to obtain the 1990 constant prices. Production of all agricultural crops are revalued at 1990 prices. Imported inputs are deflated by an index of potassic fertilizer prices, and local inputs are taken to be 10% of constant price outputs.

#### **LIVESTOCK**

The value added for livestock is estimated by the production approach. The livestock Division of the Ministry of Agriculture provides estimates of beef, pork, mutton, poultry, meat, eggs and milk production. Estimates of meat production are based on slaughter permits and an upward adjustment is made for unrecorded slaughter. Estimates on poultry an egg production are obtained from the major poultry farms. These are cross-checked for consistency with the estimates provided by the Ministry of Agriculture. Material inputs consist mostly of imported livestock feed which amounts to about 25% of the gross value of output. Local inputs are estimated at 5% or output. The constant series is obtained by the double deflation method.

### **ELECTRICITY AND WATER**

The value added in this sector is estimated by the income approach. The main source of data are the accounts of the Dominica Electricity Services and the Dominica Water & Sewage Company. The constant price estimates are extrapolated from the base year estimates on the basis of electricity sold and water supplied.

### **CONSTRUCTION**

The value added in construction is estimated by the commodity flow approach. The estimates are essentially based on imports data, since domestic output of construction material is negligible. The c.i.f. values of imports of construction material are adjusted downwards for any re-exports and for non-construction purposes; and adjusted upwards for duty, consumption tax, trade and transport margins. The value of construction materials used as inputs is assumed to be 65% of the gross value of output. This proportion has been derived on the basis of discussions with the Ministry of Communications and Works and private contractors. For the constant price estimates, the deflator used is an index of c.i.f. import prices of construction materials such as cement, wood iron and steel.

### **WHOLESALE AND RETAIL TRADE**

Value added in the trade sector is estimated by the income approach. The main source of data are the accounts of trading establishments available at the Inland Revenue Office. For non-response, adjustments are made on the basis of data on employment and remuneration available from the Social Security Department. The small traders (self-employed) and vendor trade are assumed to be a very small percentage of the total. The constant price estimates have been obtained by extrapolating the base year estimate by an index of traded goods valued at 1990 prices, covering outputs of Agriculture, Mining and Manufacturing sectors and imports.

### **HOTELS AND RESTAURANTS**

The value added estimates are obtained by the income approach. The main sources of data are the accounts at the Inland Revenue Office. To cover small hotels and restaurants the above is adjusted by 5%. The constant price estimates are derived by extrapolating the base year value added by an index of the total number of visitor arrivals.

### **TRANSPORT**

The transport sector comprised of road transport, water transport and air transport.

### **ROAD TRANSPORT**

The estimates of value added are obtained on the basis of earnings per vehicle and number of vehicles. The vehicles covered are hired trucks, buses, taxis, and hired jeeps, and their number is obtained from the licensing authorities. The earnings per vehicle are obtained on the basis of inquiries from various operators. The constant price estimates are extrapolated by the number of vehicles in each category.

### **WATER TRANSPORT**

The income approach is used to derive value added estimates for water transport, which are obtained from the accounts of port authority, shipping agents and lighter owners, and private shipping companies. The constant price estimates are derived on the basis of volume of cargo traffic and passenger arrivals and departures by sea transport.

### **AIR TRANSPORT**

This sector covers LIAT, Carib Express, air travel and airport administration. The income of travel agents and airport administration have been obtained from their accounts. The constant price estimates are based on the index of volume of passenger arrivals by air transport.

### **COMMUNICATIONS**

The estimates cover the operations of the Post Office and Cable and Wireless. The accounts of the Post Office which are available from the Government budget are analyzed to obtain compensation of employees and the constant price estimates are based on the volume of postal traffic. The accounts of Cable and Wireless for Dominica's operation are analyzed to obtain the value added in current prices. The constant price estimates are based on the a combined index of overseas call rates.

### **BANKING AND INSURANCE**

The value added estimates are obtained by the income approach. The accounts of 5 commercial banks, 22 credit unions and insurance companies are analyzed to obtain the data. For the banking sub-sector, the constant price estimates are based on the prime lending rate and credit union membership and for insurance the deflator was based on a combined index (85:15 weights), of car and property insurance rates.

### **REAL ESTATE AND DWELLINGS**

The value added estimates for owner-occupied dwellings are calculated on the basis of number of houses and average rent per house. One month's rent is subtracted as cost of repairs and

maintenance. The number of dwellings is projected on the basis of 1970, 1981 and 1991 population census data on housing and the growth of the population. The rate of rent per house for the island as a whole is assumed to be half of the low cost housing as most of the houses are of low quality. The value added at constant prices are derived first with population growth, and then inflated by the total Consumer Price Index to obtain current price estimates. The constant price value added for 1979 has been adjusted downwards on account of destruction of houses by Hurricane David. The Roseau Market Authority is engaged in real estate. The contribution to value added is very small as is based on compensation of employees.

#### **GOVERNMENT SERVICES**

The value added at current prices are obtained from analysis of the data on actual expenditure available from the computer printouts. The wages and salaries, pensions and gratuities comprise compensation of employees. The operations of the post office, airport, broadcasting and construction are excluded and allocated to their appropriate sectors. The major accounts in the government thus refer to central government, local government and Social Security Administration. Fiscal year data of central and local governments are adjusted to correspond to the calendar year. The constant price estimates are obtained by eliminating the effect of wage increase due to cost of living.

#### **OTHER SERVICE**

This sector covers business, entertainment and personal services, such as services of accounting firms, legal firms, individual professionals, domestic maids, barbers and beauty salons etc. Broadcasting and recently Cable TV have also been included. The data re based on a bench-mark estimate compiled for 1977-1978 from the Inland Revenue Office accounts and Social data on employment and remuneration. The constant price series is derived on the basis of population growth, and the current price series obtained by inflating the above with the Consumer Price Index.

#### **IMPUTED BANKING SERVICE CHARGES**

According to the recommendation of the UN SNA, the imputed banking service charges, which consists of the difference between interest earned on loans and interest paid on deposits, have been deducted from the GDP in a single line, and not allocated to individual sectors. The constant price estimates are obtained by using an average interest rate index extrapolating base year figures, as was the case for the Banking Sector.

## **FORESTRY**

The value of output covers bamboo, wood, firewood and charcoal. The estimates are obtained in consultation with the Ministry of Agriculture Forestry Department. Material inputs are estimated at 20% of gross value of output. The constant price series is obtained by the double deflation method.

## **FISHING**

For fishing, the Ministry of Agriculture Fisheries Division provided estimates of landed catch. Since December 1983, enumerators from the Ministry are collected in detailed monthly data on catch at major fishing ports. Data are also obtained from the cooperatives. For the previous years, output has been estimated on the basis of number of mechanized and non-mechanized boats and average catch per boat. The Department of Fisheries conducted an ad hoc survey in 1981 and estimated that there were 350 mechanized and 259 non-mechanized boats in fishing and they caught 8,000 lbs and 2,080 lbs of fish per boat respectively. The retail price of fish is taken as the producers' price since most of the fish is usually sold at the point of landing. The material inputs consist of expenses on fuel, bait, nets, repairs and maintenance of boats, etc. which amounts to 48.7% of the value of output for mechanized boats and 5.2% for non-mechanized boats. The constant price estimates are obtained by valuing output at 1990 prices and deducting input in the same proportion as in the current series.

## **MINING AND QUARRYING**

This is a relatively small sector and consists of only two private companies. The output covers production of gravel, stone, pumice and sand. Due to the lack of more comprehensive data for this sector, in recent years the value in Mining has been assumed to be about 10% of the value in construction in both current and constant prices.

## **MANUFACTURING**

Value added in the Manufacturing sector is estimated by the income approach. The main source of data is the Inland Revenue Office. The available income tax returns are analyzed and data on wages and salaries, depreciation and net profits, which constitute the value added, are compiled. The non-response is estimated on the basis of data on wages and salaries available from the Social Security Department. The contribution of the small scale industries and handicrafts are assumed to be 10% of the total value added. The constant price estimates are worked out by extrapolating the base year estimate on the basis of quantities of manufacturing output.

## **ANALYSIS OF THE PERFORMANCE OF THE DOMINICA ECONOMY - 1996**

**(The Dominica Economy grew by 3.71 per cent)**

### **OVERVIEW:**

The Dominica Economy grew by 3.71 per cent in real terms in 1996, despite a 5.40 per cent and 2.99 per cent drop within the Hotel and Restaurant and Construction sectors respectively. At the same time, there was significant growth within the Agriculture sector (6.21%), Manufacturing Sector (6.01%), Electricity and Water sector (7.20%), Transport sector (5.64%), Communication sector (4.23%) and Other Services sector (4.17%). It must be noted that this is the first year since 1991 that the economy has achieved a growth rate above three per cent.

### **AGRICULTURE SECTOR:**

The Agriculture sector, after experiencing two consecutive years of negative growth registered positive growth in 1996.

This sector grew by 6.21 per cent in 1996, in contrast to a decline of 8.13 per cent in 1995. This expected increase was as a result of the increase in production in banana and the fishing industry. This indicates the recovery of this sector following the destruction caused by Hurricanes Marilyn and Luis and storm Iris.

Banana exports according to the Dominica Banana Marketing Corporation reports increased by 21 per cent, moving from 32,667 tonnes in 1995 to 39,915 tonnes in 1996. Total revenue from the banana exported was valued at EC\$46.47 million, Ec\$1.68 more than 1995.

The fishing industry experienced the largest increase in the agriculture sector, with a 13.07 growth in 1996. The Livestock and forestry sub-sectors grew by 1.3 per cent, and 1.55 per cent respectively.

Overall, Agriculture contribution to real GDP for 1996 was 20.76 per cent.

#### **HOTEL AND RESTAURANT SECTOR:**

Activity within the tourism sector is largely reflected in the changes in the Hotel and Restaurant sector, and as such, this is used as a proxy in estimating tourism contribution to overall GDP. For the year under review, the Contribution of the hotel and restaurant sector to real GDP was 2.59 per cent in contrast to 2.84 per cent in 1995.

This sector registered the largest decline in real growth in 1996. This decline is attributed to the sharp fall of 22.1 percent in the number of tourists in hotel accommodations and 35.6 percent in excursionists over the year 1995.

However, the number of cruiseship passenger to the island increased by 43.4 per cent compared to 7.47 per cent in 1995, thus reflecting the success of the increased promotion of the island.

#### **MANUFACTURING SECTOR:**

Real growth of 6.01 per cent was recorded within the manufacturing sector for 1996. This growth came largely from increased activity in soap manufacture and toiletries. In addition, 1996 saw the re-opening of the card box manufacturing plant and the production of beer and guinness. The overall contribution of this sector to GDP stood at 6.92 per cent.

#### **CONSTRUCTION, MINING AND QUARRYING SECTOR:**

The construction sector registered a negative growth of 2.99 per cent. The decline in this sector over 1995, is due to the unusually large construction projects which were completed in 1995,

The percentage contribution of the construction sector was estimated to account for 8.38 per cent of total GDP.

Mining and Quarrying, a sector which generally moves in the same direction as the construction sector, declined by 2.99 per cent and contributed 0.84 percent to GDP.

#### **BANKING AND INSURANCE SECTOR:**

This sector recorded a decline of 2.61 per cent in real growth. This decline can be attributed to the sluggishness experienced in the construction activity in 1996.

Its overall contribution to GDP was 12.30 per cent in 1996. It is the fourth largest contributor to GDP preceded by wholesale and retail trade, government services and agriculture.

**COMMUNICATION SECTOR:**

This sector registered real growth of 4.23 per cent and contributed 9.37 per cent to GDP in 1996. Contributing to the growth of this sector is the introduction of the internet service.

**TRANSPORT SECTOR:**

The percentage contribution of this sector to real GDP in 1996 was estimated at 10.13 per cent with a growth rate of 5.64 over 1995. This sector benefitted from the increase in cruise ship visitors.

Of the three sub-sectors, sea transport recorded the highest growth of 8.64 per cent, followed by Air transport of 4.51 and road transport of 4.00 per cent.

**WHOLESALE & RETAIL SECTOR:**

The wholesale and retail trade which feeds off the gains made in the tourism industry recorded a 3.59 per cent real growth and contributed 12.33 per cent to real GDP .
